

Knowledge Management, Reporting Huddle System, and SharePoint

Vistra provides Knowledge Management (KM) services to plan, integrate, maintain, and transfer knowledge, enabling more complete situational understanding and facilitating overall decision-making. Through the analysis of existing business processes, information workflow, and data storage and control procedures, we identify opportunities for increased efficiencies and improvements in information sharing. We also assist clients with KM implementation through analysis of technical and business processes and/or functions; documentation of findings; and identification of areas for specific improvement.

To complement clients' KM, Vistra uses our web-based "Reporting Huddle SystemSM" to deliver insightful program and project management data at a single point, with password-protected and encrypted access. Vistra's enterprise-wide and sophisticated dashboard technology is based on NIST 800-171-compliant data reporting; our reporting likewise integrates information and status for all business functions.

Providing 24/7 connection to reports and customized information, any authorized U.S. Government (USG) professional with Internet access and a login and password can reach our dashboards with a customer link. We also integrate any related data deemed valuable—from USG's NIPRNet system, for example, with our scalable dashboard views.

Vistra also uses Microsoft SharePoint, a web-based collaborative platform—a document management and knowledge storage system—that integrates with Microsoft Office and Microsoft Teams. We configure SharePoint project sites to meet each client's customized information needs.
